

## Class Photo

Rar the Cat wants to take a class photo with all the students. To make the photo nice, he wants to arrange the students in **non-decreasing height** from left to right. Rar the Cat stands at the **leftmost position** of the photo and since he is a cat, he is very short and **effectively has height 0**.

He sees the students arrive one by one and orders each of them to stand **to the right** of the correct person. He wants to ensure that the line of students have non-decreasing height from left to right at all times. If there are multiple possible positions, the student will stand at the position **as close to Rar the Cat as possible** (i.e. choose the leftmost possible position).

### Input

The first line will be a single integer **N**. The next **N** lines each contains a name and an integer representing the name and the height of each student in the order they enter the classroom.

### Output

For each student, print the name of the student they should stand directly to the right of. You are to ensure that the students are always ordered in non-decreasing height from left to right.

Once all **N** students have arrived, print the names of the students in the photo from **left to right** separated by spaces on a single line. **Do NOT print a space at the end of this line.** Instead, print a newline after the last name.

### Limits

- $0 < N \leq 100,000$
- The names of students will only contain lowercase and uppercase English alphabets. It will also not be longer than 20 characters.
- No 2 students will have the same name.
- All the heights will range from 1 to  $10^9$  inclusive.

### Sample Testcase

Sample Input ( <b>classphoto1.in</b> )	Sample Output ( <b>classphoto1.out</b> )
5 Gary 3 Steven 6 Panda 6 Shark 10 Turtle 3	Rar Gary Gary Steven Rar Rar Turtle Gary Panda Steven Shark

**Explanation for Sample Testcase**

- Initially, the classroom only has Rar the Cat with height 0:  
**[Rar, 0]**
- After *Gary* enters the classroom, he should stand on the right of *Rar* since *Gary* is taller:  
**[Rar, 0], [Gary, 3]**
- After *Steven* enters the classroom, he should stand on the right of *Gary* since *Steven* is taller:  
**[Rar, 0], [Gary, 3], [Steven, 6]**
- Panda*'s height of 6 is higher than *Gary* but same as *Steven*. He can either stand directly to the right of *Gary* or directly to the right of *Steven* to keep the line in increasing order. However, since standing on the right of *Gary* is closer to *Rar* the Cat than standing on the right of *Steven*, you should ask *Panda* to stand on the right of *Gary* instead:  
**[Rar, 0], [Gary, 3], [Panda, 6], [Steven, 6]**
- Shark* should stand on the right of *Steven* since *Shark* is taller:  
**[Rar, 0], [Gary, 3], [Panda, 6], [Steven, 6], [Shark, 10]**
- Turtle*'s height of 3 is the same as *Gary*. He can either stand directly to the right of *Rar* the Cat or directly to the right of *Gary*. Since standing on the right of *Rar* the Cat is closer to *Rar* the Cat than standing on the right of *Gary*, he should be asked to stand on the right of *Rar* instead:  
**[Rar, 0], [Turtle, 3], [Gary, 3], [Panda, 6], [Steven, 6], [Shark, 10]**

**Notes:**

- You should develop your program in the subdirectory **ex4** and use the skeleton java file provided. You should not create a new file or rename the file provided.
- You are free to define your own helper methods and classes (or remove existing ones).
- Please be reminded that the marking scheme is:
  - Public Test Cases (1%) - 1% for passing **all** test cases, 0% otherwise
  - Hidden Test Cases (1%) - Partial scoring depending on test cases passed
  - Manual Grading (1%)
    - Overall Correctness (correctness of algorithm, severity of bugs)
    - Coding Style (meaningful comments, modularity, proper indentation, meaningful method and variable names)
- Your program will be tested with a time limit of not less than **2 sec** on Codecrunch.

**Skeleton File – Classphoto.java**

You are given the skeleton file `Classphoto.java`. You should see a non-empty file when you open the skeleton file. Otherwise, you might be in the wrong working directory.

You should see the following contents when you open the skeleton file:

```
import java.util.*;
public class Classphoto {
    private void run() {
        //implement your "main" method here
    }
    public static void main(String[] args) {
        Classphoto newClassphoto = new Classphoto();
        newClassphoto.run();
    }
}
```
